                                                                                                                                                        The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response
                                                                                                                                                                                                                                                                                                                                                   against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
  lies or alpha-synuclein aggregation in brain by administering induces immunogenic response against alpha-synuclein and/or

AAY92650-55 are peptides designed which correspond to the P2 and P30 apitopes with 5 flanking human prostate specific membrane antigen (hPSM) aditopes with 5 flanking amino acida correspond to the apitope insertion sites 6, 8 and 10. The peptides will be used in, e.g. T cell proliferation assays, but also for ELISA or other in vitro assays. The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (i.e. self-proteins), for example, hPSM, cassociated with cancers (i.e. self-proteins), for example, hPSM, comprises effecting simultaneous presentation by antigen producing calls (APCs) of the animals immune system of: (1) at least 1 CTL (cyctoxic T-lymphocyte) group derived from the PA and/or at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human. Herz and human/murine FGP8b comprising a substantial part of all known at least one foreign to the animal Analogues of human PSM, human. Thelper epitopes (e.g. pz and/or P30) are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Herz, respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

CC AAY92650-55 are peptides designed which correspond to the P2 and P30 coptopes with 5 flanking human prostate specific membrane antigen (hPSM) acids in each end. The flanking amino acids correspond to the epitope insertion sites 6, 8 and 10. The peptides will be used in, e.g. The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (i.e. self-proteins), for example, hPSM, cassociated with cancers (i.e. self-proteins), for example, hPSM, heregulin 2 (HBr2) and/or fibroblast growth factor 8b (FGPBb). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 GTL (cyctoxxic T-lymphocyte) group derived from the PA and/or at least 1 first T helper CC lymphocyte) group derived from the PA and/or at least 1 first T helper CC-lar group which is foreign to the animal. Analogues of human PSM, human Her2 and human/murine FGPBb comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope (e.g. P2 and/or P30) are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGPBb and Her2, respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

AAY92650-55 are peptides designed which correspond to the P2 and P30
captopes with 5 flanking human prostate specific membrane antigen (hPSM)
amino acids in each end. The flanking amino acids correspond to the
captope insertion sites 6, 8 and 10. The peptides will be used in, e.g. T
cell proliferation assays, but also for ELISA or other in vitro assays.

CC flacials detail a method for inducing immune responses against weakly
immunogenic cell-associated peptide antigens (PA) such as those
associated with cancers (i.e. self-proteins), for example, hPSM,
comprises effecting simultaneous presentation by antigen producing cells
comprises effecting simultaneous presentation by antigen producing cells
(APCs) of the animals immune system of: (1) at least 1 GTL (cytotoxic T-
lymphocyte) group derived from the PA and/or at least 1 first T helper
cell group which is foreign to the animal. Analogues of human PSM, human
Herz and human/murine PGP8b comprising a substantial part of all known
cc and predicted CTL and B-cell epitopes (e.g. P2 and/or P30) are also
claimed. The method is used to treat prostate, prostate/breast or breast
calliamed. The method is used to treat prostate, prostate/breast or breast
call and predicted CTL and B-cell epitope (e.g. P2 and/or P30)
claimed. The method is used to treat prostate, prostate/breast or breast
cancer when the PA is human PSM, FGF8b and Herz, respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         vaccine, LHRH; luteinising hormone releasing hormone; prostate; androgen-dependent carcinoma; antitumour; infertility; tetanus toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Helper T cell epitope; universal immune stimulator; invasin; hapten;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunogenic luteinising hormone releasing hormone peptide(s) - that suppress LHRH activity in males and females.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "tetanus toxin helper T cell epitope"

Synthetic immunogenic peptides are provided in which a universal immune stimulator is linked to a peptide or protein hapten containing B cell and/or cytotoxic T lymphocyte epitopes, giving a product which causes potent immune responses to the coupled peptide or protein. The stimulator consists of (A) a promiscuous helper T cell epitope (Th) which elicits an consists of (A) a promiscuous helper T cell epitope (Th) which elicits an compute to the coupled peptide in members of a heterogeneous population expressing diverse HLA phenotypes, and (B) an adjuvant peptide sequence from the invasin protein of Yershinia. Spacer amino acid sequence from the invasin protein of Yershinia. Spacer amino acid comains and between the immune stimulator and hapten components. When the chapten is LHRH, then optionally the invasin domain can be omitted from the immune stimulator component. The present sequence represents an LHRH-containing, invasin-free immunogenic peptide as above which can be used as a potent vaccine for treating e.g. proteatic hyperplasia, androgendependent carcinoma, prostatic carcinoma, testicular carcinoma, cysts, (severe) premenstrual syndrome or oestrogen-dependent breast cancer, or for induction of infertility.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                        The invention relates to a novel pharmaceutical composition for preventing or treating a disease characterised by amyloid fibril deposits camyloid plaques) in a patient. The pharmaceutical composition comprises an agent that will induce an immune response against an amyloid component, or an antibody or antibody fragment that binds to an amyloid component. The invention also relates to a method for determining the prognosis of a patient undergoing treatment for an amyloid disorder which involves measuring a patient serum amount of immunoreactivity against a selected amyloid component. A patient serum immunoreactivity of at least four times a base line serum immunoreactivity control level indicates a prognosis of improved status with respect to the disorder. The pharmaceutical compositions of the invention are useful for treating a wide variety of disorders include Alzheimer's disease characterised by amyloid beta apptide fibril deposits, type 2 diabetes characterised by amyloid beta apptide fibril deposits, type 2 diabetes characterised by amyloid beta peptide fibril deposits, tuberculosis) characterised by Antibring derived from serum amyloid A protein (AppSAA); systemic semile amyloid serum amyloid A protein (AppSAA); systemic semile amyloid serum amyloid A protein (AppSAA); systemic semile amyloid serum amyloid A protein (AppSAA); systemic semile amyloid serum amyloid A protein (AppSAA); systemic semile amyloid serum amyloid A protein (AppSAA); systemic semile amyloid serum amyloid A protein (AppSAA); systemic semile amyloid serum amyloid serum amyloid action protein deposits, and beta-2-microglobulin deposits which form as a result of long term haemodialysis treatment. The present sequence composition to treat or prevent Alzheimer's disease. (Updated on 11-SEP-SCOOL treatdardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gonadotrophin releasing hormone; GnRH; synthetic immunogen;

The invention relates to a synthetic immunogen for inducing specific antibodies against gonadotropin releasing hormone (GnRH also known as luteinising hormone releasing hormone, LHRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer), endometriosis, uterine fibroids, benign prostatic hypertrophy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel synthetic immunogen for inducing immune response against gonadotropin releasing hormone, comprises fusion peptide having promiscuous helper T-cell peptide epitope and immunomimic peptide epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    prostate cancer. The immunogen is effective in eliciting high and specific anti-GnRH antibody titres. The present sequence is a synthetic

The specification describes N-Acylated pseudopeptides, which have a neutral or charged acidic group at one terminal and a functionalized auxiliary spacer at the other. The pseudopeptides show immunomodulatory and adjuvant action, based on activation of antigen presenting cells (e.g. macrophages or dendritic cells), induction and induction of deferentiation of dendritic cells, induction of cytokine production and induction of action of action of cytokine production and induction of action of cytokine production and induction of macuration of manuncompetent cells, induction of cytokine production and induction of and lymphoid organs. They reinforce humoral and cellular immunity. They can be grafted onto antigens (to modulate immune response) or onto drugs (to improve the therapeutic activity or targeting). The pseudopeptides (to improve the therapeutic activity or targeting). The pseudopeptides or diagnostic agents. Typically, the pseudopeptides are used as adjuvants together with (or covalently bonded to) antigens for vacchation against with holod cells ex vivo, to render the cells immunocompetent before reintroduction in vivo; or used in therapy of certain autoimmune continuated to be present expressents a peptide which may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 112; DB 4; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ઠ
                                                                                                                                                                                                                                                      The specification describes N-Acylated pseudopeptides, which have a neutral or charged acidic group at one terminal and a functionalized auxiliary spacer at the other. The pseudopeptides show immunomodulatory and adjuvant action, based on activation of antigen presenting calls (e.g. macrophages or dendritic cells), induction of differentiation of dendritic cells, induction of cytokine production and induction of maturation of immunocompetent cell strains originating from hematopoeitic and lymphoid organs. They reinforce humoral and cellular immunity. They can be grafted onto antigens (to modulate immune response) or onto drugs (to improve the therapeutic activity or targeting). The pseudopeptides are thus useful in human or veterinary medicine as immunizing or diagnostic agents. Typically, they are used as adjuvants together with correctly bonded to) antigens for vaccination against viral, parastic/protozoal, microbial or fungal infections; incubated with blood cells ex vivo, to render the cells immunocompetent before reintroduction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                    auxiliary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 in vivo; or used in therapy of certain autoimmue diseases. The pseudopeptides are useful as carriers for antigens or other therapeutic agents due to their ability to form non-covalent bonds via the hydrophobic or hydrophilic auxiliary spacer. The present sequence represents a peptide, which has 5 possible conjugation sites for the pseudopeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                            New amphiphilic acylated pseudopeptides having a functionalized a
spacer, useful as immunomodulators, e.g. as adjuvants in vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 36;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Indels

ó
the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (MI) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a linear fusion of the tetanus toxoid peptide corresponding to amino acid 830-844 and 947-967 used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to a synthetic immunogen for inducing specific antibodies against gonadorropin releasing hormone (GnRH also known as luteinising hormone releasing hormone, LHRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer), endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GnRH antibody titres. The present sequence is a synthetic immunogen of the invention

component, or an antibody or antibody fragment that binds to an amyloid component, or an antibody or antibody fragment that binds to an amyloid component, or an antibody or antibody fragment that binds to an amyloid component. The invention also relates to a method for determining the prognosis of a patient undergoing treatment for an amyloid disorder which involves measuring a patient serum amount of immunoreactivity against a selected amyloid component. A patient serum immunoreactivity of at least four times a base line serum immunoreactivity control level indicates a prognosis of improved status with respect to the disorder. The pharmaceutical compositions of the invention are useful for treating a wide variety of disorders characterised by amyloid beta peptide fibril deposits; type 2 diabetes characterised by anyloid beta peptide fibril deposits; type 2 diabetes characterised by islet amyloid protein peptide (IAPP, amylin) fibrils; reactive systemic amyloidosis associated with systemic inflammatory diseases (e.g., theumatodia arthritis, osteomyelitis, tuberculosis) characterised by AA fibrils derived from serum amyloid A protein (ApoSSA)); systemic senile camyloidosis and familial amyloid cardiomyopathy characterised by ATTR (fibrils derived from transthypetin (TTR); transmissble spongiform represents an immunogenic fusion protein comprising an amyloid beta peptide fused fus a universal T-cell epitope which may be used in a composition to treat or prevent Alzheimer's disease. (Updated on 11-SEP-2003 to standardise OS field) encephalopathies (e.g. Creutzfeld-Jakob disease, Kuru) characterised by prion protein deposits; and beta-2-microglobulin deposits which form as result of long term haemodialysis treatment. Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific antibody.

Disclosure; Page 31; 143pp; English

This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the Drain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Fc receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have noctropic and neuroprotective activity. The method is also useful for monitoring a course of treatment methods are useful for prophylactic and therapeutic treatment of Alzheimer's disease

eventing or treating disease such as Parkinson's disease characterized Lewy bodies or alpha-synuclein aggregation in brain by administering ent that induces immunogenic response against alpha-synuclein and/or beta-amyloid. Preventing agent

Disclosure; SEQ ID NO 35; 78pp; English.

The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-symuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-symuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-symuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-symuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-symuclein or Abeta

amyloid beta peptide fibril deposits; type 2 diabetes characterised by islet amyloid protein peptide (IAPP, amylin) fibrils; reactive systemic amyloidosis associated with systemic inflammatory diseases (e.g., rheumatoid arthritis, osteomyelitis, tubercullosis) characterised by AA fibrils derived from serum amyloid A protein (ApoSSA); systemic senile amyloidosis and familial amyloid cardiomyopathy characterised by ATTR fibrils derived from transthyretin (TTR); transmissible spongiform corphalopathies (e.g. Creuuzfeld-Jakob disease, Kuru) characterised by prion protein deposits, and beta-2-microglobulin deposits which form as a result of long term haemodialysis treatment. The present sequence repetised to a universal T-cell epitope which may be used in a composition to treat or prevent Alzheimer's disease. (Updated on 11-SEP-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or

```
Novel synthetic immunogen for inducing immune response against gonadotropin releasing hormone, comprises fusion peptide having promiscuous helper T-cell peptide epitope and immunomimic peptide epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antibodies against gonadotropin releasing hormone (GnRH also known as thetanishing hormons releasing hormone, LHRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer),
                                                                                                           Gonadotrophin releasing hormone, GnRH; synthetic immunogen;

The pharmaceutical composition comprises an agent that will induce an immune response against an amyloid component, or an antibody or antibody fragment that binds to an amyloid component. The invention also relates to a method for determining the prognosis of a patient undergoing treatment for an amyloid disorder which involves measuring a patient serum amount of immunoreactivity of at least selected amyloid component. A patient serum immunoreactivity of at least prognosis of improved status with respect to the disorder. The prognosis of improved status with respect to the disorder. The pharmaceutical compositions of the invention are useful for treating a wide variety of disorders characterised by amyloid fibril deposition in a patient. Such disorders include Alzheimer's disease characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amyloid disease; amyloid fibril deposition; amyloid plaque; immunogenic; antibody; vaccine; Alzheimer's disease; type 2 diabetes; reactive system amyloidosis; systemic senile amyloidosis; familial amyloid cardiomyopathy; transmissible spongiform encephalopathy; Creutzfeld-Jakob disease; Kuru, haemodialysis-asssociated beta-2-microglobulin deposition; amyloid beta peptide; universal T-cell epitope; neuroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition comprising immunogen against amyloid component such as fibril peptide or protein, or antibody against amyloid component useful for treating amyloid diseases or amyloidoses.
endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GnRH antibody titres. The present sequence is a synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Foreceptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or beta-amyloid.
                                                                                                                                Gaps
methods are useful for prophylactic and therapeutic treatment of Alzheimer's disease

The specification describes N-Acylated pseudopeptides, which have a neutral or charged acidic group at one terminal and a functionalized auxiliary spacer at the other. The pseudopeptides show immunomdulatory and adjuvant action, based on activation of antigen presenting cells (e.g. macrophages or dendritic cells), induction of differentiation of dendritic cells, induction of cytokine production of differentiation of dendritic cells, induction of cytokine production of differentiation of macuration of immunocompetent cell strains originating from hematopoeitic and lymphoid organs. They reinforce humoral and cellular immunity. They can be grafted onto antigens (to modulate immune response) or onto drugs (to improve the therapeutic activity or trargeting). The pseudopeptides crethus useful in human or veterinary medicine as immunizing or diagnostic agents. Typically, they are used as adjuvants together with (or covalently bonded to) antigens for vaccination against viral, parasitic/protozoal, microbial or fungal infections; incubated with blood cells extinct the service of the control of the cells immunocompetent before reintroduction in vivo; or used in therapy of certain autoimmune diseases. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New immunogenic branched polypeptide derivs. - used as antigens in enzyme immunoassays and as anti sporozoite vaccines against Plasmodium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The peptide is a specific example of highly generic immunogenic substituted lysines or polylysines having a number n (where n is 1-15) of L-lysine amino acid residues of alpha and epsilon amide linkage, where (n+1)/2 of the alpha amino groups and/or (n+1)/2 of the epsilon amino groups are substituted with polypeptides consisting of one or more plasmodial B epitopes covalently bound to one or more peptides with an amino acid sequence corresponding to that of a T epitope such as FNNFTVSFWLRVPKVSASHLEA or QYIKANSKFIGITE. The branched polypeptides can be used as immunogens for preparing genetically non-restricted antimalaria vaccines and for determining anti-plasmodium antibodies in blood, serum and blood-spot samples. Determination can be effected by ELISA. See also AAR14261-2, AAR14264-5 and AAR15316
                                                                                                                                                                                                                                  /note= "epsilon amino substituted by Lys in which both alpha and epsilon amino groups are substituted with the sequence (NANP) 6QYIKANSKFIGITEFNNFTVSFWLRVPKVSASHLE"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        neutral or charged acidic group at one terminal and a functionalized auxiliary spacer at the other. The pseudopeptides show immunomodulatory and adjuvant action, based on activation of antigen presenting cells of e.g. macrophages or dendritic cells, induction of differentiation of manuscompenent cells, induction of cytokine production and induction of manuscompenent cells, induction of contraction of immunocompenent cells, induction of manuscompenent cells, induction of manuscompenent cells, induction of contraction of immunocompenent cells, induction and induction of manuscompenent cells, induction of immunocompenent cells, induction and induction of immunocompenent cells, induction activity or targeting. The pseudopeptides are thus useful in human or veterinary medicine as immunizing or diagnostic agents. Typically, the pseudopeptides are used as adjuvants together with (or covalently bonded to) antigens for vaccination against viral, parasitic/protozoal, microbial or fungal infections; incubated with blood cells sa vivo, to render the cells immunocompetent before
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

the invention relates to a method for immunising animals (including humans) against autologous ghrelin. The method involves presenting ghrelin basequence thereof) or a ghrelin analogue comprising a ghrelin becall epitope and non-ghrelin chemical moieties to the immune ghrelin B-cell epitope and non-ghrelin chemical moieties to the immune compositions comprising the production of antibodies against the animal s autologous ghrelin. The invention also relates to immunogenic compositions comprising ghrelin, a ghrelin sub-sequence or a ghrelin analogue of the invention; a nucleic acid a canalogue of the invention; a nucleic acid a method of identifying a modified ghrelin polypeptide capable of inducing antibodies against unmodified autologous ghrelin; and use of immunogenic compositions of the invention. The method of the invention is useful for treating, preventing or ameliorating obesity or other conditions confracting by access body fat deposits by downregulating ghrelin to such an extent that the total amount of body fat is significantly contact the total amount of body fat is significantly contact the contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of another contact of anot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               may also be used for treating wound or burns, in adjuvant therapy for in vitro fertilisation, and for treating ghrelin and ghrelin-receptor related cancers. The present sequence represents a ghrelin analogue

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The peptide is a specific example of highly generic immunogenic substituted lysines or polylysines having a number n (where n is 1-15) of L-lysine amino acid residues of alpha and epsilon anide linkage, where (n+1)/2 of the alpha amino groups and/or (n+1)/2 of the epsilon amino groups and/or (n+1)/2 of the epsilon amino groups and/or (n+1)/2 of the epsilon amino groups and/or (n+1)/2 of the epsilon amino groups and/or (n+1)/2 of the epsilon amino amino adjustmedial B epitopes covalently bound to one or more peptides with an amino acid sequence corresponding to that of a T epitope such as FNNFTVSFWLRVPRVSARHLEA or QTIKANSKFIGITE. The branched polypeptides can be used as immunogens for preparing genetically non-restricted antimalaria vaccines and for determining anni-plasmodium antibodies in blood, serum and blood-spot samples. Determination can be effected by ELISA. See also AAR14262 - AAR14265 and AAR15436
                                                                                                                                                                                                                                                                                                                                                                                                               /note= "epsilon-amino group substituted with Lys in which both alpha and epsilon amino groups are substituted with the sequence FNNFTVSFWLRVPKVSASHLE(NANP)10"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New immunogenic branched polypeptide derivs. - used as antigens in enzyme immunoassays and as anti sporozoite vaccines against Plasmodium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                    substituted with the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mature rat ghrelin with added epitopes (peptide 3), SEQ ID NO:15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                      Immunogenic branched polypeptides for antimalarial vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The peptide is a specific example of highly generic immunogenic substituted lysines or polylysines having a number n (where n is 1-15) of L-lysine amino acid residues of alpha and epsilon anide linkage, where (n+1)/2 of the alpha amino groups and/or (n+1)/2 of the epsilon amino groups and/or (n+1)/2 of the application of the epsilon amino groups are substituted with polypeptides consisting of one or more palsamodial B epitopes covalently bound to one or more peptides with an amino acid sequence corresponding to that of a T epitope such as FNNFTVSFWLRVPKVSASHLEA or QYIKANSKFIGITE. The branched polypeptides can be used as immunogens for preparing genetically non-restricted antimalaria vaccines and for determining anti-plasmodium antibodies in blood, serum and blood-spot samples. Determination can be effected by ELISA. See also AAR14261 - AAR14264, AAR14266 and AAR15436

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New immunogenic branched polypeptide derivs. - used as antigens in enzyme immunoassays and as anti sporozoite vaccines against Plasmodium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            οŧ
                                                                                                                                                                                                                                                                                                                                        /note= "epsilon amino substituted by Lys in which both the alpha and epsilon amino groups are substituted with further Lys residues, the latter two Lys residues each being substituted on the alpha amino by FNNFTVSFWIARVEXCASHL. E(KANP)10 and on the epsilon amino by the sequence VQGEESNDK"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The peptide is a specific example of highly generic immunogenic substituted lysines or polylysines having a number n (where n is 1-15) of 1-19sine amino acid resaddues of alpha and egalion anide linkage, where (n+1)/2 of the alpha amino groups and/or (n+1)/2 of the epsilon amino groups and/or (n+1)/2 of the epsilon amino groups are substituted with polypeptides consisting of one or more plasmodial B epitopes covalently bound to one or more peptides with an amino acid sequence corresponding to that of a T epitope such as FNNFTVSFWLRVPKVSASHLEA or QYTKANSKFIGITE. The branched polypeptides can be used as immunogens for preparing genetically non-restricted antimalaria vaccines and for determining anti-plasmodium antibodies in blood, serum and blood spot samples. Determination can be effected by ELISA. See also AAR14262 - AAR14265 and AAR15436
                                                                                                                                                                                               /note= "epsilon amino substituted by Lys in which the alpha amino is substituted with the sequence TENNTTVSFWIRVSPRICE(NANP) 10 and the epsilon amino is substituted with the sequence VQGEESNDK"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                  /note= "epsilon amino substituted by the sequence

Mature ghrelin with added epitopes (peptide 4), SEQ ID NO:16.

17-JUN-2004 (first entry)

```
Ghrelin; autologous ghrelin; ghrelin analogue; immunogen; immunisation; anti-ghrelin antibody; obesity; anorexia; cachexia; wound; burn; adjuvant therapy; in vitro fertilisation; ghrelin-related cancer; ghrelin receptor-related cancer; anorectic; cytostatic; metabolic; immunomodulator; vulnerary; vaccine; epitope.
                                                                                                                                                                                                                                                                              Immunizing against autologous ghrelin in animals e.g. human beings, useful for treating obesity, by presenting ghrelin polypeptide, its subsequence or analog, to animal's immune system, for producing antibodies against ghrelin.
Mature ghrelin with added epitopes (peptide 5), SEQ ID NO:17.
                                                                                                                                                                                                                                                                                                                                   Example 1; SEQ ID NO 17; 83pp; English.

The invention relates to a method for immunising animals (including humans) against autologous ghrelin. The method involves presenting ghrelin (or sub-sequence thereof) or a ghrelin manleque comprising a ghrelin are leaders comprising a ghrelin. The invention of antibodies against the system, thereby inducing the production of antibodies against the system, thereby inducing the production of antibodies against the smalled is autologous ghrelin. The invention also relates to immunogenic compositions comprising ghrelin, a ghrelin sub-sequence or a ghrelin analogue of the invention; a nucleic acid encoding a ghrelin analogue of the invention; vectors and host cells comprising this nucleic acid; a method of identifying a modified ghrelin polypeptide capable of inducing antibodies against unmodified autologous ghrelin; and use of immunogenic compositions of the invention. The method of the invention is useful for treating, preventing or amelioration obesity or other conditions characterised by excess body fat deposits by downregulating ghrelin to such an extent that the total amount of body fat is significantly decreased. The method may also be used for upregulating ghrelin for the treatment, prevention or amelioration of anorexia or cachexia. The method may also be used for treating wound or burns, in adjuvant therapy for in viro fertilisation, and for treating sphrelin and ghrelin analogue comprises comprising mature ghrelin with added epitopes used in an example of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to a method for immunising animals (including humans) against autologous ghrelin. The method involves presenting a ghrelin for a ghrelin analogue comprising a ghrelin for a ghrelin analogue comprising a ghrelin breels poitope and non-ghrelin chemical moieties to the immune system, thereby inducing the production of antibodies against the animal's autologous ghrelin. The invention also relates to immunogenic compositions comprising ghrelin, a ghrelin sub-sequence or a ghrelin analogue of the invention; a nucleic acid encoding a ghrelin analogue of the invention; a nucleic acid encoding a ghrelin analogue of the invention; vectors and host cells comprising this nucleic acid; a method of identifying a modified ghrelin polypeptide capable of inducing antibodies against unmodified autologous ghrelin, and use of immunogenic compositions of the invention. The method of the invention is useful for treating, preventing or ameliorating obesity or other conditions treating preventing or ameliorating obesits by downregulating ghrelin to such an extent that the total amount of body fat is significantly decreased. The method may also be used for upregulating ghrelin for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              treatment, prevention or amelioration of anorexia or cachexia. The method may also be used for treating wound or burns, in adjuvant therapy for in vitro fertilisation, and for treating ghrelin and ghrelin-receptor related cancers. The present sequence represents a phrelin analogue comprising mature ghrelin with added epitopes used in an example of the

The invention relates to a method of preventing (MI) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (MI) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "epsilon amino substituted with Lys in which alpha and epsilon amino groups are each substituted with the sequence (NANP)3FNNFTVSFWLRVDFVSASHLE(NANP)10K"
                                                                                                                                                                                                                                                                                                                                 Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or beta-amyloid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "epsilon amino substituted with the sequence (NANP) 3FNNFTVSFWLRVPKVSASHLE (NANP) 10K"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Foreepptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                  The peptide is a specific example of highly generic immunogenic substituted lysines or polylysines having a number n (where n is 1-15) of L-lysine amino acid residutes of alpha and epsilon anide linkage, where (n+1)/2 of the alpha amino groups and/or (n+1)/2 of the epsilon amino groups are substituted with polypeptides consisting of one or more plasmodial B epitopes covalently bound to one or more peptides with an amino acid sequence corresponding to that of a T epitope such as FNNFTVSFWLRVPKVSASHLEA or QTIKANSKFIGITE. The branched polypeptides can be used as immunogens for preparing genetically non-restricted antimalaria vaccines and for determining anti-Plasmodium antibodies in blood, serum and blood-spot samples. Determination can be effected by ELISA. See also AAR14261 - AAR14263, AAR14265 and AAR15436

                                                                                                                                                                                                                                                  The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
reventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or beta-amyloid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antiparkinsonian; antibody therapy; Lewy body; alpha-synuclein; aggregation; brain; immunogenic response; beta-amyloid; Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô

the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (MI) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response improves motor characteristics of the patient, and the administration in useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "identical to residues 267-314 of human GDF-8"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  70. .109
/note= "identical to residues 336-375 of human GDF-8"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "Cys-73 may be substituted by Ser to avoid disulfide bond formation"

The present sequence is that of AutoVac construct GDF-8 p30-2, comprising the 109 C-terminal amino acid residues of human growth differentiation factor 8 (GDF-8) in which residues 49-69 are replaced by the promiscuous tetanus toxin T-cell epitope 200 (see AAB20144). It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as P30, with minimal disturbance of the authentic 3-dimensional structure of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibiotic feed-additives. Anti-GDF8 vaccines can europhy is pronounced and for patients suffering from acute and chronic heart failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

differentiation factor 8 (GDF-8) in which residues of human growth differentiation factor 8 (GDF-8) in which residues 84-104 are replaced by the promiscuous tetanus toxin T-cell epitope 810 (see AAB20144). It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-33) are capable of breaking autocolerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as P30, with minimal disturbance of the authentic 3-dimensional structure of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibiotic feed-canditives. Anti-GDF8 vaccines can be used to treat human diseases such as cancer cachexia where muscle atrophy is pronounced and for patients suffering from acute and chronic heart failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                        Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1. .78

The present sequence is that of AutoVac construct GDF-8 P30-3A, comprising the 109 C-terminal amino acid residues of human growth differentiation factor 8 (GDF-8) in which residues 79-99 are replaced by differentiation factor 1-cell epitope P30 (see AAB20144). It is an collect of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against autologous GDF-8. They comprise the Cterminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as P30, with minimal discurbance of the authentic 3-dimensional structure of the protein.

Wholeic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibiotic feed-additives. Anti-GDF8 vaccines can be used for reat human diseases such as cancer cachexia where muscle atrophy is pronounced and for patients suffering from acute and chronic heart failure
                                                                                                                                                                                                                                                                                                        Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.
/note= "identical to residues 366-375 of human GDF-8"

The present sequence is that of AutoVac construct GDF-8 P30-1, comprising the 109 C-terminal amino acid residues of human growth differentiation factor 8 (GDF-8) in which residues 2-41 are replaced by the promiscuous tetanus toxin T-cell epitope P30 (see AAB20144). It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-5) are capable of breaking autotolerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as P30, with minimal disturbance of the authentic 3-dimensional structure of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the encidence of animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibiotic feed-additives. Anti-GDF8 vaccines can atrophy is pronounced and for patients suffering from acute and chronic heart failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.

This invention relates to a novel immunogenic composition comprising an response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate chuman vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 sequences as having a similar conformational shape to native human IL-13 con-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS) As such, these compositions, which exhibit dermatological and antiasthmatic accivities, can be used via gene therapy to transmit disease (COPD), asthma or susceptible to chronic obstructive sequence is the chimeric human IL-13 protein containing a tetanus p30 peptide (immunogen 2) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

```

This invention relates to a novel immunogenic composition comprising an immune cresponse by recognising human II-13 and one or more foreign T-cell cepitopes. Specifically, it refers to a method for producing a human chimeric II-13 immunogen formulated in a appropriate manner to generate a human vaccine. The present invention describes human chimeric II-13 sequences as having a similar conformational shape to native human II-13 conformational shape to native human II-13 conformational shape to native human II-13 conformational shape to mature human iII-13 conformation in airway hyper-responsiveness (ARR), conformation and state in a reduction in airway hyper-responsiveness (ARR), conformation hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the method results in a reduction in airway hyper-responsiveness (ARR), concus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene theorapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide cortices is the chimeric human II-13 protein containing a tetanus p30 sequence is the chimeric human IL-13 pr peptide (immunogen 2) of the invention

The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition comprises an immunogen that is capable of generating an immune response against self interleukin-13 (IL-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonuclectide containing at least one unmethylated G motif and a saponin. The IL-13 minunogen is preferably a human IL-13 supplemented with foreign T-helper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allergies or dermatities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      eprivee, the vaccine composition is useful for freating astima or COPD, or atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence represents a human IL-13/tetanus toxin P30 epitope immunogen of the invention.
                                                                                                                         Interleukin-13; IL-13; self immunogen; CpG oligonucleotide; saponin; asthma; chronic obstructive pulmonary disease; COPD; atopic disorder; hayfever; contact allergy; dermatitis; vaccine; antiasthmatic; respiratory; antiallergic; dermaticlogical; human; T-helper epitope; tetanus toxin; P30; mutant; mutein

                                                                                                                                                               Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                           The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chimeric human IL-13 protein with a tetanus toxin p30 peptide SegID 13

These involve the use of interlevin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition it is possible that they may be used in the treatment of cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                               This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 equences as having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian appecies, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, gobte cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide gequence is the chimeric human IL-13 protein containing a tetanus p30 peptide (immunogen 4) of the invention.
                                         New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             airway hyper-responsiveness, AHR; mucus hyper-secretion;

This invention relates to a novel immunogenic composition comprising an Inla invention relates to a novel immunogenic composition on immune response by recognising human IL-13 and one or more foreign T-cell cepitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate channer of a human vaccine. The present invention describes human chimeric IL-13 cequences as having a similar conformational shape to native human IL-13 con-human mammanian species, to enhance its immunogenicity, actributable to con-human mammanian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticostercide (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric human IL-13 protein containing a tetanus p30
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                        New vaccine composition useful for treating asthma, Chronic obstructive pulmonary disease or atopic disorders, e.g. dermatitis, comprises an immunogen generating an immune response against interleukin-13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Interleukin-13; IL-13; self immunogen; CpG oligonucleotide; saponin; asthma; chronic obstructive pulmonary disease; COPD; atopic disorder; hayfever; cortact allergy; dermatitis; vacchine; antiathmatic; respiratory; antiallergic; dermatological; mouse; murine; T-helper epitope; tetanus toxin; P30; mutant; mutein.

Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                        The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases.                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                            The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition occuprises an immunogen that is capable of generating an immune response against self interleukin-13 (IL-13) and am adjuvant composition comprising a combination of an immunostimulatory oligonuclectide containing at least one unmethylated CG motif and a saponin. The IL-13 immunogen is preferably a human IL-13 supplemented with foreign T-helper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence represents a murine IL-13/tetanus toxin P30 epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Asthma; IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                Vaccine composition useful for treating asthma, Chronic Obstructive Pulmonary Disease or atopic disorders, e.g. dermatitis, comprises immunogen generating an immune response against interleukin-13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .;

Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                      Asthma, IL-5, interleukin-5, allergy, cytokine, helminthic infection, cancer, eosinophilia, vaccine, allergic rhinitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Asthma; IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 128;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                     Asthma, IL-5, interleukin-5, allergy, cytokine, helminthic infection, cancer, eosinophilia; vaccine, allergic rhinitis.

Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
    involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and helminthic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Asthma, IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                  Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IJ-5) analogues and modified IJ-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention is concerned with methods of treating asthma, eosinophilia, allergic trhintis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and

Down-regulating interleukin S (IL-S) activity in humans by administering IL-S and/or an IL-S analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Asthma, IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.

Down-regulating interleukin 5 (IL-5) activity in humans by administering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analoques and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and helminthic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                             IL-5; interleukin-5; allergy; cytokine; helminthic infection;
eosinophilia; vaccine; allergic rhinitis.
        it is possible that they may be used in the treatment of cancer and helminthic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 132;

                                            Down-regulating interleukin 5 (IL-5) activity in humans by administering
                                                                                                                                   The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin.5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition,
                                                           IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or
amelioration of asthma or other chronic allergic conditions.

                                                                                                                                                                                                                                                                                                                                                                                    The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                          IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or
amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chimeric murine IL-13 protein with tetanus toxin p30 peptide SegID 14.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                     This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune corresponse by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in a appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 (while having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, conn-human mammalian species, to enhance its immunogenicity. Accordingly, mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric murine IL-13 protein containing a tetanus p30
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                         New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mouse; immunogenic; IL-13; interleukin-13; vaccine;

This invention relates to a novel immunogenic composition comprising an Inl-13 (interleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell captiopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 con-human mammalian species, to enhance its immunogenicity, attributable to non-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airay hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airawsys and skin irritation, as well as reducing the requirement for inhaled corticostercids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy corticus in the chimeric murine IL-13 protein with humanised amino acid sequence is the chimeric murine IL-13 protein with humanised amino acid invariant activities is substitutions containing a tetanus p30 peptide (immunogen 6) of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Chimeric murine IL-13 protein with tetanus toxin p30 peptide SeqID 15.

New vaccine composition useful for treating asthma, Chronic obstructive pulmonary disease or atopic disorders, e.g. dermatitis, comprises an immunogen generating an immune response against interleukin-13.

Disclosure; SEQ ID NO 15; 89pp; English.

This invention relates to a novel immunogenic composition comprising an immune in the invention relates to a novel immunogenic composition an immune ceasing by recognishing human II-13 and one or more foreign T-cell ceptropes. Specifically, it refers to a method for producing a human chimeric II-13 immunogen formulated in an appropriate manner to generate the mean vaccine. The present invention describes human chimeric II-13 sequences as having a similar conformational shape to native human II-13 while having sufficient amino acid sequence diversity, attributable to con-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to traveat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric murine IL-13 protein with humanised amino acid increase. invention

This invention relates to a novel immunogenic composition comprising an response by recognising human IL-13 and one or more foreign T-cell response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human vaccine. The present invention describes human chimeric or a human vaccine. The present invention describes human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence its immunogenicity. Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), the method results in a reduction in airway hyper-responsiveness (AHR), the airways and skin irritation, as well as reducing the requirement for inhaled corticostercides (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric murine IL-13 protein containing a tetanus p30

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition comprises an immunogen that is capable of generating an immunos response against self interleukin-13 [L-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonucleotide companishing at least one unmethylated CG motif and a saponin. The IL-13 immunogen is preferably a human IL-13 supplemented with foreign T-helper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence represents a murine IL-13/tetanus toxin P30 epitope immunogen of the invention.
                                                                                                                                                                                                                                                                                                              Interleukin-13; IL-13; self immunogen, CpG oligonucleotide; saponin; asthma; chronic obstructive pulmonary diseas; COPD; atopic disorder; hayfever; contact allergy; dermatitis; vaccine; antiasthmatic; respiratory; antiallergic; dermatological; mouse; murine; T-helper epitope; tetanus toxin; P30; mutant; mutein.

The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition comprises an immunogen that is capable of generating an immune response against self interleukin-13 (IL-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonuclectide containing at least one unmethylated CG motif and a saponin. The IL-13 immunogen is preferably a human IL-13 supplemented with foreign T-helper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, context allergies or dermatitis. The present sequence represents a chimeric IL-13 (comprising the human IL-13 with murine IL-13 b-cell epitopes)/tetanus toxin P30 epitope immunogen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 132;

                                                                                                  셤
                                                                                                                                                                            This invention relates to a novel immunogenic composition comprising an regonse by recognising human L1-13 (interleukin-13) element that is capable of driving an immune response by recognising human II-13 and one or more foreign T-cell cpitopes. Specifically, it refers to a method for producing a human chimeric II-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric II-13 sequences as having a similar conformational shape to native human II-13 con-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiaethmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric human II-13 protein containing an N-terminal

This invention relates to a novel immunogenic composition comprising an immune cresponse by recognishing human IL-13 and one or more foreign T-cell ceptropes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate to human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 sequences as having a similar conformational shape to native human IL-13 con-human mammalian species, to enhance its immunogenicity, attributeable to con-human mammalian species, to enhance its immunogenicity, accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithalial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals subfering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric human IL-13 protein containing non-human amino containing mon-human amino contains.
New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.

New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.

Disclosure; SEQ ID NO 19; 89pp; English.

This invention relates to a novel immunogenic composition comprising an II-13 (interleukin-13) element that is capable of driving an immune response by recognishing human II-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric II-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric II-13 sequences as having a similar conformational shape to native human II-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individual Suffering from or susceptible to chronic obstructive pulmonary disease (CODD), asthma or atopic dermatis. This polypeptide sequence is the chimeric human II-13 protein containing non-human amino of the invention of a substitutions and an N-terminal tetanus p30 peptide (immunogen 10) the invention

This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell cepitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate channer or IL-13 immunogen formulated in an appropriate manner to generate concurrent and the present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 con-human mammalian species, to enhance its immunogenicity, attributable to con-human mammalian species, to enhance its immunogenicity, accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to tread individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric human IL-13 protein containing non-human amino acid subbatilutions and an N-terminal tetanus p30 peptide (immunogen 10)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human; immunogenic; II-13; interleukin-13; vaccine; airway hyper-responsiveness; AHR; mucus hyper-secretion; agoblet cell metaplasia; sub-epithelial fibrosis; skin irritation; inhaled corticosteroid; ICS; dermatological; antiasthmatic; gene therapy; chronic obstructive pulmonary disease; COPD; asthma; atopic dermatilis; chimeric; tetanus p30.

This invention relates to a novel immunogenic composition comprising an immune response by recognising human II-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric II-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric II-13 sequences as having a similar conformational shape to native human II-13 sequences as having a similar conformational shape to native human II-13 while having sufficient amino acid sequence diversity, attributable to non-unuan mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, gobbet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy; to treat individuals suffering from or susceptible to chronic obstructive sequence is the chimeric human II-13 protein containing an N-terminal expenses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New vaccine composition useful for treating asthma, Chronic obstructive pulmonary disease or atopic disorders, e.g. dermatitis, comprises an immunogen generating an immune response against interleukin-13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

This invention relates to a novel immunogenic composition comprising an response by recognising human IL-13 and one or more foreign T-cell ceptropes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate chimeric IL-13 immunogen formulated in an appropriate manner to generate confinences as having a similar conformational shape to native human IL-13 sequences as having a similar conformational shape to native human IL-13 con-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), the method results in a reduction in airway hyper-responsiveness (AHR), con-human mammalian species, to enhance its immunogenicity, Accordingly, the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasehmatic activities, can be used via gene therapy contract individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric human IL-13 proctein containing non-human amino containing intervals. Chronic obstructive New vaccine composition useful for treating asthma, Chronic obstructi pulmonary disease or atopic disorders, e.g. dermatitis, comprises an immunogen generating an immune response against interleukin-13.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition comprises an immunogen that is capable of generating an immune response against self interleukin-13 (IL-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonuclectide containing at least one unmethylated CG motif and a saponin. The IL-13 immunogen is preferably a human IL-13 supplemented with foreign repitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence represents a human IL-13-derived immunogen of the invention which comprises a further mutated version of human IL-13 immunogen I and the tetanus toxin P30 epitope.
                                                                                                                                                                                                                                                                                                    Human IL-13 mutant/tetanus toxin P30 epitope immunogen 10, SEQ ID NO:19

```
The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition comprises an immunogen that is capable of generating an immune response against self interleukin-13 [L-13] and an adjuvant composition comprising a combination of an immunostimulatory oligonucleotide containing at least one unmethylated CG motif and a saponin. The IL-13 immunogen is preferably a human IL-13 supplemented with foreign T-helper epitopes, or is a non-human IL-13 supplemented with foreign T-helper epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence represents a human IL-13-derived immunogen of the invention which comprises human IL-13 immunogen 1 (ADL97933 and the
                                                                                                                                                                                                                                                                                                                                                                                     Human IL-13 mutant/tetanus toxin P30 epitope immunogen 9, SEQ ID NO:18.

The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition ocomprises an immunogen that is capable of generating an immune response against self interleukin-13 (IL-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonuclectide containing at least one unmethylated CG motif and a saponin. The IL-13 minunogen is preferably a human IL-13 supplemented with foreign T-helper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence repersents a human IL-13/tetanus toxin P30 epitope
                                                                                                                                                                                                                                                                                                                                               Interleukin-13; IL-13; self immunogen; CpG oligonucleotide; saponin; asthma; chronic obstructive pulmonary disease; COPD; atopic disorder; hayfever; contact allergy; dermatitis; vaccine; antiaethmatic; respiratory; antiallergic; dermatological; human; T-helper epitope; tetanus toxin; P30; mutant; mutein.

Pharmaceutical composition comprising immunogen against amyloid component such as fibril peptide or protein, or antibody against amyloid component useful for treating amyloid diseases or amyloidoses.

```
The invention relates to a novel pharmaceutical composition for preventing or treating a disease characterised by amyloid fibril deposits (amyloid plaques) in a patient. The pharmaceutical composition comprises an agent that will induce an immune response against an amyloid component, or an antibody or antibody fragment that binds to an amyloid component. The invention also relates to a method for determining the component. The invention also relates to a method for determining the involves measuring a patient undergoing treatment for an amyloid disorder which involves measuring a patient serum amount of immunoreactivity against a component. The inproved status with respect to the disorder. The four times a base line serum immunoreactivity control level indicates a prognosis of improved status with respect to the disorder. The prognosis of improved status with respect to the disorder. The compositions of the invention are useful for treating a vide variety of disorders include Alaheimer's disease characterised by amyloid beta apptide fibril deposits; type 2 diabetes characterised by amyloid beta apptide fibril deposits; type 2 diabetes characterised by amyloid obsta poptide fibril deposits; tuberculosis) characterised by amyloid carthritis, osteomyelitis, tuberculosis) characterised by Attibulated from serum amyloid A protein (ApoSSA); systemic semile amyloid carthritis (error from serum amyloid A protein (ApoSSA); systemic semile composites and familial amyloid cardiomyopathy characterised by ATTR fibrils derived from transthyretin (TTR); transmissible spongiform composition to treat or prevent Alzheimer's disease. (Updated on 11-SEP-CC composition to treat or prevent Alzheimer's disease. (Updated on 11-SEP-CC composition to treat or prevent Alzheimer's disease. (Updated on 11-SEP-CC composition to treat or prevent Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page 46; 140pp; English.

```
Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated thus reduce and undleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and helminthic infections
